inflammation; immune response; inflammatory disorder; Crohn's disease; atherosclerosis; arthritis; pulmonary fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a macrophage derived chemokine (MDC) analogue. The MDC analogue is capable of inhibiting MDC induced chemotaxis. Therefore, the MDC analogue may be used to modulate inflammatory and immune responses allowing for the treatment of disorders associated with excessive inflammation or overactive immune responses. Inflammation or year of the include Croin's disease (manifested by chronic inflammation of the bowel), atherosclerosis, arthritis and pulmonary fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               2 GPYGANMEDSVCCRDYVRYRLDLRVVKHFYWTSDSCPRPGVVLLTFRDKELCADPRVPWV

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A new macrophage derived chemokine, MDC, a member of the C-C (Cys-Cys) subfamily of cytokines has been isolated. MDC and it's analogues may be used in the treatment of inflammatory diseases specially diseases characterised by monocyte chemotaxis towards a site of inflammation. MDC and it's analogues also induce fibroblast proliferation having a positive effect in wound healing and angiogenesis. They may prove to be clinically important in the treatment of tumours, by directly or indirectly inhibiting tumour formation. Antibodies directed against MDC and its analogues may be used in the treatment of Crohn's disease, rheumatoid arthritis and atherosclerosis. Probes and/or primers for the identification of MDC encoding sequences can be derived from MDC encoding sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Macrophage derived chemokine; MDC; chemotaxis; chemotactic cytokine;

                                                                                                                                                             The present sequence represents synthetic analogue MDC(n+1) of the novel human macrophage derived C-C chemokine MDC (see also AAV05871). MDC(n+1) consists of a Leu residue following by amino acid residues 1-69 of the MDC mature polypeptide. The analogue is expected to be an antagonist of MDC activity, inhibiting activity by competitively binding to the receptor that recognises MDC or. by forming inactive heterodimers with MDC. MDC antagonists are used in claimed methods for the preparation of medicaments for the suppression of the proliferation of a mammalian immunodeficiency virus, for inhibiting platelet aggregation in a mammal, for the treatment or palliation of lupus erythematosus in a mammal, for inhibiting MDC-induced activation, chemotaxis or proliferation of cells that express CCR4, for inhibiting or palliating an allergic reaction in a mammal, and

Nucleic acid sequences encoding the chemokines can be used for detection, in e.g. forensic techniques. Antibodies and other blinding agents may be used in diagnostics. The chemokines themselves are useful for treatment of, e.g. cancer or degenerative conditions. Abnormal proliferation, regeneration, degeneration or atrophy may be treated by

The present sequence represents human STCP-1. STCP-1 polypeptides demonstrate chemokine activity for T-cells. The polypeptides are useful prophylactically or therapeutically to treat HIV infection and other conditions associated with viral/bacterial pathogens infecting T-cells, macrophages or other immune system cells. They can be included (optionally chemically modified) with a pharmaceutically acceptable carrier and optionally other pharmaceuticals (e.g. AZT, antibiotics etc.) in therapeutic compositions for treating these conditions. STCP-1 also useful to assay for inhibitory compounds used to reduce circulatory system STCP-1 levels to allevate e.g. joint inflammation associated with rheumatoid arthritis, lupus or other autoimmune diseases. The polypeptides are also useful to prepare antibodies or hybridomas. The nucleic acids are useful to produce hybridisation probes to test for STCP-1 DNA/RNA in mammallan samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               25 GPYGANMEDSVCCRDYVRYRLPLRIVVKHFYWTSDSCPRPGVVLLTFRDKEICADPRVPWV 84

                                                                                                                                                                                                                                              C(ys-cys) subfamily of cytokines has been isolated. MDC and it's analogues may be used in the treatment of inflammatory diseases especially diseases characterised by monocyte chemotraxis towards a site of inflammation. MDC and it's analogues also induce fibrohast proliferation having a positive effect in wound healing and anglogenesis. They may prove to be clinically important in the treatment of tumours, by directly or indirectly inhibiting tumour formation. Antibodies directed against MDC and its analogues may be used in the treatment of Crohn's disease, rhemmatoid arthritis and atherosclerosis. Probes and/or primers for the identification of MDC encoding sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human STCP-1 polypeptides with chemokine activity - useful e.g. to treat HIV infection or other viral or bacterial pathogens infecting T-cells, macrophages or other immune system cells
                                                                                                  Macrophage derived chemokine (MDC) and analogues - used in the treatment of inflammatory diseases, MDC antibodies used to treat Crohn's disease, rheumatoid arthritis, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .;

This protein is used to produce the antibodies of the invention. The antibodies are useful for purifying MDC polypeptides, for detecting endogenous MDC in a host, and for modulating binding of MDC to its receptors. The DNA encoding this sequence can be used for identifying and
                                              Nucleic acid sequences encoding the chemokines can be used for detection, in e.g. forensic techniques. Antibodies and other binding agents may be used in diagnostics. The chemokines themselves are useful for treatment of, e.g. cancer or degenerative conditions. Abnormal proliferation, regeneration, degeneration or atrophy may be treated by the inventive

This belongs to the CC class of chemokines. The efficacy of a vaccine is enhanced by combining it with one or more chemokines to enhance the immune response to an antigen. This can be humoral or cell-mediated immune response purified chemokines, fragments, derivatives or analogues are administered either concurrently with one or more purified antigens against which an immune response is desired or within a time period either before or after antigen administration. The chemokine gene is isolated by PCR, and administered by constructing an expression plasmid vector which can be expressed in a coordinated manner upon introduction in a suitable cell. The vaccines are immunostimulatory and can be used to treat microbial diseases especially HIV.
                                                                                                                                                                                                                                                                                                                   1 GPYGANMEDSVCCRDYVRYRLPLRVVKHFYWTSDSCPRPGVVLLTFRDKEICADPRVPYL

Therefore, the MDC analogues may be used to modulate inflammatory and immune responses allowing for the treatment of disorders associated with excessive inflammation or overactive immune responses. Inflammatory disorders which may be treated in this way include Crohn's disease (manifested by chronic inflammation of the bowel), atherosclerosis, arthritis and pulmonary fibrosis. The present sequence represents human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Description

Patent No. 5932703
GENERAL INFORMATION
APPLICANT: Godiska, Ronald
APPLICANT: Gray, Patrick W.
TITLE OF INVENTION: MACROPHAGE DERIVED CHEMOKINE AND CHEMOKINE
TITLE OF INVENTION: ANALOGS
NUMBER OF SEQUENCES: 32
CORRESPONDENCE ADDRESS:
ADDRESSEE: Marshall, O'Toole, Gerstein, Murray & Borun
STREET: 6300 Sears Tower, 233 South Wacker Drive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ocore 374; DB 5; Length 93;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 30, Application US/09067447
GENERAL INFORMATION:
APPLICANT: Gray, Patrick W.
APPLICANT: Gray, Patrick W.
APPLICANT: Raport, Carol J.
TITLE OF INVENTION: MACROPHAGE DERIVED CHEMOKINE (MDC) AND
TITLE OF INVENTION: CHEMOKINE ANALOGS AND ASSANT TO IDENTIFY MODULATORS OF MDC ACT
NUMBER OF SEQUENCES: 44
CORRESPONDENCE ADDRESS:
ADDRESSEE: Marshall, O'Toole, Gerstein, Murray & Borun
                     APPLICANT: RAPOIT, CATOL J.
TITLE OF INVENTION: MACROPHAGE DERIVED CHEMOKINE (MDC) AND
TITLE OF INVENTION: CHEMOKINE ANALOGS AND ASSSAY TO IDENTIFY MODULATORS OF MDC ACT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 GPYGANMEDSVCCRDYVRYRLPLRVVKHFYWTSDSCPRPGVVLLTFRDKEICADPRVPYL 60

   Politz O., Kodelja V., Guillot P., Orfanos C.E., Goerdt S.,
"The genomic locus for the AMAC-1 gene contains possible pseudo-exons
within the first intron sequence.";
Submitted (DEC-1998) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: CHEMOTACTIC FACTOR THAT ATTRACTS LYMPHOCYTES BUT NOT
MONOCYTES OR GRANULOCYTES. MAY BE INVOLVED IN B CELL MIGRATION
INTO B CELL FOLLICLES IN LYMPH NODES. ATTRACTS NAIVE T LYMPHOCYTES
TOWARD DENDRITIC CELLS AND ACTIVATED MACROPHAGES IN LYMPH NODES,
HAS CHEMOTACTIC ACTIVITY FOR NAIVE T CELLS, CD4+ AND CD8+ T CELLS
AND THUS MAY PLAY A ROLE IN BOTH HUMORAL AND CELL-MEDIATED
IMMUNITY RESPONSES.

disorders associated with excessive inflammation or overactive immune responses. Inflammatory disorders which may be treated in this way include Crohn's disease (manifested by chronic inflammation of the bowel), atheroscierosis, arthritis and pulmonary fibrosis.
   The present sequence represents synthetic analogue MDC-eyfy of the novel human macrophage derived C-C chemokine MDC (see also AAY05871). MDC-eyfy consists of amino acid residues 1-69 of the MDC mature polypeptide, with residues 20-31 (His-Phe-Tyr-Trp) replaced with the sequence Glu-Tyr-Phe-Tyr. derived from the amino acid sequence of the chemokine RANTES. The analogue is expected to be an antagonist of MDC, inhibiting activity by competitively binding to the receptor that recognises MDC or by forming inactive heterodimers with MDC. Alternatively, MDC eyfy may confer some of the activities RANTES, such as chemotaxis of I lymphocytes, monocytes or

   A new macrophage derived chemokine, MDC, a member of the C-C (Cys-Cys) subfamily of cytckines has been isolated. MDC and it's analogues may be used in the treatment of inflammatory diseases especially diseases characterised by monocyte chemotaxis towards a site of inflammation. MDC and it's analogues also induce fibroblast proliferation having a positive effect in wound hearling and anglogenesis. They may prove to be clinically important in the treatment of tumours, by directly or indirectly inhibiting tumour formation. Antibodies directed against MDC and its analogues may be used in the treatment of Crohn's disease, rheumatoid arthritis and atherosclerosis. Probes ang/or primers for the identification of MDC
  Gaps
   The present sequence represents a macrophage derived chemokine (MDC) analogue. MDC analogues are capable of inhibiting MDC induced chemotaxis. Therefore, the MDC analogues may be used to modulate

  A new macrophage derived chemokine, MDC, a member of the C-C (Cys-Cys) subfamily of cytckines has been isolated. MDC and it's analogues may be used in the treatment of inflammatory diseases especially diseases characterised by monocyte chemotaxis towards a site of inflammation. MDC and it's analogues also induce fibroblast proliferation having a positive effect in wound healing and angiogenesis. They may prove to be clinically important in the treatment of tumours, by directly or indirectly inhibiting tumour formation. Antibodies directed against MDC and its analogues may be used in the treatment of Crohn's disease, rheumatoid arthritis and atherosclerosis. Probes and/or primers for the identification of MDC encoding sequences can be derived from MDC encoding sequences.
  Gaps
  MDC; macrophage derived chemokine; C-C; Cys-Cys; Crohn's disease; rheumatoid arthritis; chemotaxis; fibroblast proliferation;
   Macrophage derived chemokine (MDC) and analogues - used in the treatment of inflammatory diseases, MDC antibodies used to treat Crohn's disease, rheumatoid arthritis, etc.

   Chemokine; human, detection; forensic; diagnostic; treatment; cancer; degenerative condition; abnormal proliferation; regeneration;
  The present sequence represents synthetic analogue MDC(n+1) of the novel human macrophage derived C-C chemokine MDC (see also AAY05871). MDC(n+1) consists of a Leu residue following by amino acid residues 1-69 of the MDC mature polypeptide. The analogue is expected to be an antagonist of MDC activity, inhibiting activity by competitively binding to the receptor that recognises MDC or by forming inactive heterodimers with MDC. MDC antagonists are used in claimed methods for the preparation of medicaments for the suppression of the proliferation of a mammalian immunodeficiency virus, for inhibiting platelet aggregation in a mammal, for the treatment or palliation of lupus erythematosus in a mammal, for inhibiting MDC-induced activation, chemotaxis or proliferation of cells that express CRR4, for inhibiting or palliating an allergic reaction in a mammal, and

The present sequence represents human STCP-1. STCP-1 polypeptides demonstrate chemokine activity for T-cells. The polypeptides are useful prophylactically or therapeutically to treat HIV infection and other conditions associated with viral/bacterial pathogens infecting T-cells, macrophages or other immune system cells. They can be included (optionally chemically modified) with a pharmaceutically acceptable carrier and optionally other pharmaceuticals (e.g. AZT, antibiotics etc.) in therapeutic compositions for treating these conditions. STCP-1 also useful to assay for inhibitory compounds used to reduce circulatory system STCP-1 levels to allevate e.g. joint inflammation associated with rheumatoid arthritis, lupus or other autoimmune diseases. The polypeptides are also useful to prepare antibodies or hybridomas. The nucleic acids are useful to prepare antibodies or hybridomas. The nucleic acids are useful to produce hybridisation probes to test for STCP-1 DNA/RNA in mammalian samples.

antibodies are useful for purifying MDC polypeptides, for detecting endogenous MDC in a host, and for modulating binding of MDC to its receptors. The DNA encoding this sequence can be used for identifying and isolating non-human MDC homologues. The MDC protein is potentially useful for treating inflammatory disorders, cancer, etc. Antagonists of MDC can be used for treating crohn's disease, arthritis, atherosclerosis etc.
   9
   The present sequence is macrophage-derived chemokine. This belongs to the CC class of chemokines. The efficacy of a vaccine is enhanced by combining it with one or more chemokines to enhance the immune response to an antigen. This can be humoral or cell-mediated immune response. The purified chemokines, fragments, derivatives or analogues are administered either concurrently with one or more purified antigens against which an immune response is desired or within a time period either before or after antigen administeration. The chemokine gene is isolated by PCR, and administered by constructing an expression plasmid vector which can be expressed in a coordinated manner upon introduction

   The present invention describes macrophage derived chemokine (MDC) analogues which are capable of inhibiting MDC induced chemotaxis. Therefore, the MDC analogues may be used to modulate inflammatory and immune responses allowing for the treatment of disorders associated with excessive inflammation or overactive immune responses. Inflammatory disorders which may be treated in this way include Crohn's disease (manifested by chronic inflammation of the bowel), atherosclerosis, arthritis and pulmonary fibrosis. The present sequence represents human
  in a suitable cell. The vaccines are immunostimulatory and can be used to treat microbial diseases especially HIV.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Miniocyte chemoattractant cytokine RANTES precursor - human
NyAlternate names: small inducible cytokine A5; T-cell specific cytokine RANTES
C;Species: Homo sapiens (man)
C;Species: Homo sapiens (man)
C;Date: 30-Jun-1989 #sequence\_revision 16-Aug-1996 #text\_change 29-May-1998
C;Accession: A28815
R;Schall, T.J.; Jongstra, J.; Dyer, B.J.; Jorgensen, J.; Clayberger, C.; Davis, M.M;
J. Immunol. 141, 1018-1025, 1988
A;Title: A human T cell-specific molecule is a member of a new gene family.
A;Reference number: A28815; MUID:88285659; PMID:2456327

A; Molecule type: mRNA A; Residues: 1-91 <SCH>

PLACENTA, BONE MARROW, DENDRITIC CELLS PRESENT IN GERMINAL CENTERS AND T-CELL AREAS OF SECONDARY LYMPHOID ORGANS AND MACROPHAGES DERIPHERAL BLOOD MONOCYTES. NOT EXPRESSED BY PERIPHERAL BLOOD MONOCYTES. NOT EXPRESSED BY DERIPHERAL BLOOD MONOCYTES AND A MONOCYTE-TO-MACROPHAGE DIFFERENTIATION IS A PREREQUISITE FOR EXPRESSION. IL-4, IL-13, AND INDUCTION. SPECIFICALLY INDUCED IN MACROPHAGES BY IL-4, IL-13, AND EXERT A SLIGHTLY POSITIVE SYNENGISTIC EFFECT IN COMBINATION WITH IL-4. STRONGLY INDUCED IN SEVERAL HUMAN CELL LINES, INCLUDING MONOCYTIC Q1937 CELLS, BY PHORBOL MYRISTATE ACETATE (PMA).

SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE C-C) (CHEMOKINE CC).
